In current usage, the term remote sensing generally refers to the use of satellite- or aircraft-based sensor technologies to detect and classify objects on Earth, including on the surface and in the atmosphere and oceans, based on propagated signals (e.g. electromagnetic radiation). Types of data acquisition - Data processing - History - Training and education. Remote sensing is the art and science of making measurements of the earth using sensors on airplanes or satellites. These sensors collect data in the form of images and provide specialized capabilities for manipulating, analyzing, and visualizing those images. Remote sensed imagery is integrated within a GIS.

Remote sensing is the technology we use to map things that people cannot physically map. This includes volcanoes, the ocean floor, even the moon!. Remote sensing applications primarily involves interpretation and analysis of electromagnetic radiations interacting with earth and its. In geography, the term remote sensing takes on a specific connotation dealing with space-borne and aerial imaging systems used to remotely sense. Remote sensing is the process of detecting and monitoring the physical characteristics of an area by measuring its reflected and emitted radiation at a distance. Remote sensing is concerned with the collection of data by a sensing device not in contact with the object being sensed, and the evaluation of the collected. Remote sensing is the science of obtaining information about objects or areas from a distance, typically from aircraft or satellites.
